Hi ... Part array, part HT.I am here because I doubt if most HT guys are that familiar with arrays.I have 34 each (17 pair) of 6 1/2" 4 ohm paper duo cone car speakers that sound really good. Pioneer TS-163P, 92 SPL. Box says "40-20,000hz", tee hee. In reality a horn tweeter may be needed.What would be the optimum way to split them up for a 5.1 system? Not sure how music videos and movies affect choice(s). ASSume save 2 for spares. I believe they are discontinued. Impedance (4-8) should not be a problem as draw will be low. Almost forgot, want them OB. Zene
Ebay pic, not me.
