Dear Mr. Parham:I apologize for what some might perceive to be an excessively disparaging or even testy tone to my first post.  I am a brain damaged rapid cycling manic depressive, and this sometimes makes me a bit abrasive.If I am reading the plots on your website correctly the plot for the JBL 18" driver in a Pi Alignment shows it to be a full Bel down at around 45 Hz.  I am guessing that this does not reflect room boost, but I don't know.  Also is this the 7Pi corner horn alignment?Do you know or could you give me an educated guess of what sort of deep bass response I could reasonably expect from my JBL 2245H 18" woofers in extremely strongly constructed 7Pi corner horns in a good room?Thanks for your time.Sincerely,Don Reid
