I like all three. If you were running a solid state amp, I could nail this down a bit more but with tube amps, there is more difference between amps. So the best thing to do would be to hear all three and decide for yourself.

speaker is more capable of high SPL. But running a tube amp, that isn't a consideration, whereas

sounds good.

makes it tend to sound good on low power SET amps that might have trouble pushing the bass on other speakers. It also has a slightly underdamped alignment, which makes it provide useful bass response even when power levels are low and/or no boundary reinforcement is possible. This is a good speaker for use with amps like the Zen or in open spaces out away from walls and other boundaries.

Please tell me your E-Mail address and I'll send you the plans.
