I see what you mean now. You wanted to make a two-way speaker with a Delta 12LFA and a Vifa DX25. It might work, but it might be too much a stretch. I haven't really looked into it. I do know the Delta 12LFA works very nicely together with a PSD2002, and crossover to a DX25 isn't much higher in frequency, so it might work. If you try it, let us know how it works out.You could also make a three-way or a so-called 2.5 way speaker. The mid-driver doesn't have to be used at deep bass frequencies, so the box surrounding it doesn't have to be large. Put a small internal cabinet for the mid-driver inside the main cabinet. You can easily make a cabinet less than 5ft3 that contains a Delta 12LFA and a midrange driver and cabinet and a tweeter.
