Hallo,Potentiometer on my vintage Sherwood SEL 400 (about 1973) integrated amplifier is broken, damaged-no way to repair. Potentiometer has three sections - two for stereo, plus one - last section for power on off swich. Theare is already loudness correction on the last 1/3 of full lenght. Nominal resistance is 50k Ohm, it is linear, otherway dimensions are quite ordinary one. (Theare is already label on potentiometer with marks: CTS, Type TV-TCC)Bad news is that it is quite rearly to find such potentiometer those days in electronic shops. Almost unpossibleI would realy very appreciate every information or help to find that potentiometer.(my e-mail is: peter.bergant@elektro-ljubljana.si) Best regards, Peter
