Hi there! I have a full AIWA system (actually my brother's, but he lent it to me to use). It consists of P50 DC stereo amp, C50 Preamp, and R50 tuner (they all go together). I use it along with a nice subwoofer for music, movies, radio, computer, etc. I do have some info, the amplifier, I believe is rated at 50WRMS continuous per channel into 8 ohms. Actually, all you have to do is look at the front and there is a single light-up power meter that reads up to 100W into 8 ohms, which I believe

is a rating for both channels combined.Hope this helps

Hi Norman! It seems that you don't have an amplifier there. What you have is a preamp. A preamp is a "controller" that goes before the power amplifier and it basically controls the signal (volume, bass, treble, pan etc.) and input and has one output that goes to the amplifier to made loud. So you need to get an amplifier to use with the speakers.Hope that helps.If you need any general advice on what sort of amplifier you might need, please ask along with the details of the speakers you plan on using.

Hi, i have the same kit, with the remote control receiver R300... but without the controller...
is anyone able to help me to find another one ? or the code that is used, then i can program another remote ?

Many Thanks
