Hi All; Eric if you are out there; Quick question; how do you feel about A DD bridge for an SE triode, 211 or the Svetlana 572. I know the dual diodes will run 900 volts on the plate, As per the tech. bulletin. Can I ask if they will go 1100 plate voltage 70ma. plate current for 12 v. output in class A? There is an example of this on the net but no schematic. Thanks J.R.
