I've had the components since January and I am about to start building the enclosures this weekend.

I noticed Fred built a pair with centered drivers. Is there an advantage doing it this way?

I also saw that there is an updated crossover. I will go with the original crossover to begin with because I have the parts, but may look into building the alternative for comparison.

Anything else I should consider before I begin?

Thanks in advance.

David

What do you mean by centered drivers?

For the most recent pair I didn't offset the drivers on the front baffle. Most DIY speaker builders offset the drivers to reduce baffle edge diffraction, while most commercial speaker makers don't because of the added production and distribution costs. I've found it doesn't make enough difference to matter, and it's simpler and more aesthetically pleasing with them positioned on the center line.

So.... Fred,

We're talking about line arrays without a tweeter line? With a tweeter line, the center is an imaginary line down the edge of the 3 inch midrange speaker in my speakers, since I have a tweeter line.

I seem to think that I read somewhere that these baffle adjustments only make a difference for point source speakers but when you start lining up more than 8 speakers in a line source that the issues dissolve to smaller and smaller db loss until its below 1 db which is not hearable in music(maybe in single tones though).

Isn't here a piece of software that shows the loss with different numbers of speakers due to baffle effects?

We're talking about line arrays without a tweeter line?
Marlboro

Yes, this design has more compromises than most to get the parts cost down to \$285. A tweeter array just wasn't possible. A short array of Dayton 3/4" neo's would have been nice, but that wouldn't work because the crossover would have to be too high for the 5.25" woofers. A single Fountek ribbon would have been nice too, but that would have increased the cost by about 50%.

The Art Array isn't the only "budget" line array to incorporate a single dome tweeter.

<http://www.gryphon-audio.dk/content/product.asp?ProductID=27>

Seriously, it's hard to imagine that a company would design such an expensive speaker and use a single dome tweeter instead of a tweeter array.

Fred,

Only the bass unit is a line array with 8 inch woofers and a heavy duty equalizer. The other speaker that looks like an array is NOT. It is an wmmmtmmw where the "w" is a mid bass unit, and the "t" is a revelator tweeter with a "horn" type waveguide.

"...with four 5" Gryphon midbass drivers (two at the top and two at the bottom) and four of the 5" Gryphon midrange drivers originally developed for the Cantata (two directly above and two directly below the central high frequency driver).

"The legendary Scan Speak Revelator ring radiator high-frequency driver is modified with a 1 kg aluminum housing, designed by Gryphon for perfect time alignment and minimal diffraction."

Got it. Too bad they didn't build a line array instead.

Hello all.

I'm new to the forum and to speaker building, but excited about the new hobby. I just completed the Zigmahornets as my first projet, and am now looking at tackling the ART Arrays. Like Fred I prefer the drivers centered and will also recess them into the baffle.

Fred, you mentioned on your smugmug pages adding an updated crossover designed by Pete Schumacher. Would you mind sharing the schematic? I've not built a crossover before, so this will be a new challenge.

Thank you

Nick

You'll find the updated crossover schematic in this thread:
<http://techtalk.parts-express.com/showthread.php?t=209376>

The tweeter circuit includes a 1.2 ohm series resistor. I found a three or four ohm sounds better. I'm using a four ohm.

If anybody would like to build a pair of these speakers, Scott Placke has generously offered to supply all the parts at the OEM price, which is slightly less than \$300. You will need to call Scott at PE and tell him you want the RMAF Art Array "kit". There is no "kit", and the Art Arrays have nothing to do with the RMAF, but that's where I see Scott every year, and if you say "Fred's RMAF Art Array Kit" he'll know what you're talking about.

Here's the parts list:

- Sixteen #295-301 5.25" Dayton Classic woofers
- Two #264-578 Vifa DX-25 tweeters
- Two #255-206 0.15mH 18ga air core inductors
- Two #255-266 2.0mH 18ga air core inductors
- Two #027-350 33uF electrolytic caps
- Two #027-408 Dayton 0.68uF poly caps
- Two #027-418 Dayton 3.0uF poly caps
- Two #027-426 Dayton 8.2uF poly caps
- Two #027-434 Dayton 18uF poly caps
- Two #027-440 Dayton 30uF poly caps
- One #095-282 pack .205 quick disconnects
- One #095-286 pack .110 quick disconnects
- One #100-116 50ft 16ga speaker wire
- Two #260-303 speaker terminals
- One #081-435 pack of 100 #6 screws
- Two #004-3 three ohm resistors
- Two #004-12.5 resistors

The 33uF electrolytic goes in the woofer zobel, the 30uF and the 3uF metallized poly caps are paralleled to form the required 33uF in the tweeter circuit. The schematic also calls for a 1.2 ohm series resistor in the tweeter circuit, but I found the tweeter was too bright and substituted a 3 ohm. The 12.5 ohm is used instead of the 15 ohm in Pete's schematic - this value isn't critical. To keep things simple for Scott I request that you order this with no substitutions.

Fred,

Thank you for the information. It's certainly a bonus to get the parts even cheaper.

On a separate note, I was also intrigued by the Fredarrays you built and wondered how they stacked up against the ART Arrays? I wouldn't mind trying to build either one (assuming you don't mind someone building your arrays), but would like to hear your thoughts on if one was superior to the other.

Thanks

Nick

Nick

The Art Arrays are much better. The FredArrays were built using Silver Flute woofers and an MCM titanium dome tweeter. The tweeter had to be crossed at a relatively high frequency, and it never blended with the woofers as well as I would have liked. Also, the Dayton woofers are quite a bit less expensive than the Silver Flutes, which now sell for about \$19ea versus \$10 for the Daytons.

I got one of the enclosures glued up last night. 22 clamps!!!

Now I need to install the insulation and the drivers. Can't wait to hear these guys.

Super cool! Looks like a good time was had by all. I really love those little local get-togethers. You get a fair amount of time to check out the gear, and some good fun with good friends. Can't beat that!
