20W of PP is fairly easy, even for a Class A design. KT88's and consevative operation can get there with excellent sound. There are of course other valves than the KT88, but it is an easy example. Take the Hammond 5k/100W 1650 output TX. A pair of good KT88's, a PS to deliver 350V at 250 mA DC. I suggest a choke input filter, valve rectification and film caps(oil filled AC motor run), and borrow the Merlin amp front end(

http://audioroundtable.com/GroupBuild/Projects/). As soon as I get off my backside and forward Wayne a copy of the hybrid mods to the front end, you'll see another option useable for Pete's amp as well. It is a MOSFET/triode cascode and does a brilliant job with the E-Linear circuit.I am a bit biased to suggest PP, but it does well for me. If you must have SE, there is plenty to borrow between the two topologies.cheers,Douglas
