Thanks for this link. Seems to be a concensus regarding the fact that rubber ages due to ozone and hydro-carbon exposure. Has anyone ever read anything from maybe a chemical journal or possibly from a manufacturer of these compounds that gave a specific description of the aging process and how it manifests in suspension components?I am presently using an older Empire low output MC that was stored for about 18 yrs. It tracks the HFNRR disc up to the most difficult track. I can't see any drawbacks yet; but I am still playing replaceable stuff.
