
Subject: Crossfader question

I recently bought a Vestax PMC-270a mixer that had a bleeding crossfader. I just installed a new one (20mm) that has lines that look like this: ||||| |||||. On the one that was bleeding, it had a bell shaped curve. I have several questions: 1) What's a good length (20, 45 or 60mm) for hip-hop/electronica DJ's? 20mm right now seems a bit too short 2) My understanding is that there are different mix curves. How do I find out if my mixer supports that, or does the crossfader determine that? 3) Is the PMC-270a okay for both scratching hip-hop and mixing electronica? If not, what's a decent one that's good for beginners/intermediate? Thanks! Andrew
