Hi, this table works great except for the feature where you select what size record you're playing and the stylus moves to and drops on the lead-in. on my table the stylus overshoots the lead-in by a few millimeters and so starts playing partway through the first track. I'm not very familiar with TT's and see no obvious place to fine tune this feature. In case there are a couple different styles of the PL-570,
this is the one I'm talking about
