My first project was to replace the speaks in an old pair of Nakamichi desktop 2 ways with Fostex FE127e's, cut out the back and plug up the port hole. There is a variation on this called the Bob 3 here...main difference I can see is that some absorbent material is used on the baffle. If that rubberized stuff is not available, PE has some product for damping sound in car panels like door skins etc. I think Fitz mentioned this as a way to a line array as well.
Bob 3
