Dear Garrett, I did design a cross over for that combination back in 1984, and yes, even back then it was a computer assisted design. My speakers which are still in use, are actually two and a half ways, as they are diffraction compensated. I can easily adapt the design to a straight two way. I used these speakers on location, mainly for outside concert broadcast work. The musicians I worked with always held them in high regard. If you are interested contact me  
Regards, Mark.
