The speaker was made in the '70's. It was the first computer designed with a computer.   Gordon
Culp, (who I believe had passed away) was a high energy physicist from Cal Tech who designed
a 26 variable computer optimization program.   They were constructed with little regard to
cosmetics (they were usually painted flat black), but had a (for then) very solid build. The original
tweeters were Peerless paper, later, around 1974, they went to the Philips mylar dome. They
were made in Chatsworth, California.
