I have no experience with ribbonsbutsince no one else has replied yet-appropriate filtering must be used.-high enough order-correct Fc-phase controls?-Enough knowledge to use /design the filter system taking into account transducers being used.The 15" woofer-must be a low distortion type -good alignment of flat or overdamped response 'non boomy 'as im sure that ribbons demand the best quality.Woofer distortions extending into the midrange will destroy the entire sound.see www.linkwitzlab.com -thor subwoofer.Cheers!
