If the speaker can't hit 100dB at the listening position, it's just not an option for me. my 40hz horn gets 115db at listening position with 20watts (measured as 12v into 8ohm if i remember correctly,, V^2/R ...:-) I'm making up the plans for my mate, he's buying the other 8" off me, and building horn. Cheers
