Sd-12 on horns!! still cannot ever guess what will happen while looking at a drivers t/s specs. the high Fs didnt fase me,it seems higher Fs woofers seem to have less 'wobble' in response? or is that incorrect.i see the kappa 12 from eminence exhibits something similar-relatively smooth response,shelved low end due to small mouth.compare to my old shiva horn designs with +5db at 90hz peakies..the dpl12 with Fs=16hz had a wobble response,where as the lab12 with Fs=22hz wasnt so bad..Interesting! il consider this woofer for next project..also the copper shorting ring is good news for distortions..Cheers!

sd-12
