OK, so I'm an idiot, but I can't find a fully satisfactory answer on my own so I'm asking for a little info.The Klipsch crossovers used on the "real" line of speakers (Type A, Tpye AA) have what look to be bell transformers in them. Are these really transformers for impedence matching (or some other purpose I can't imagine) or are they just inductors built into frames for mounting purposes?Thanks for any help.
