I wouldn't necessarily say that. What is for sure is that they are two different ways to get to high sensitivity, arrays and horns, and which is the better way is in my mind very much an economics decision. The line array is user friendly in that it doesn't require the space that a horn does for equal SPL, but it does need a lot of drivers, so it can end up the pricier option. But if you can get the drivers on the cheap I think the line makes more sense. It really boils down to a case by case situation.
