Theres no way to make a basshorn smallAll you can do is make it highly compromisedI wouldnt shorten a horn in groups youl miss your lows- i would make the mouth smaller. That way the mouths will add when placed in close proximity.You can compromise a basshorn down to using an 8" Peerless Csx on a 135litre 104db/1watt basshorn(50hz loading) But thats about it !To get higher output,more larger capable driver.. eg Csx 10" or lab12 on 300litre horn with 2600cm^2 mouth for 50hz..Cheers!

labhorn infos
