Quite True!! But this is the problem! If the low order nonlinearities are irrelevant and the higher order ones are the important ones, then we are looking at the wrong thing, right!! I get a lot of calls from loudspeaker manufacturers who say that they have found no correlation in second and third harmonic distortion levels and subjective quality. They want to know if I have a way out of this situation. Of course I do - Hire us! Not always what they wanted to hear.
