Subject: Attenuate amp inputs Posted by Barry Solof on Sun, 22 May 2005 13:25:42 GMT

Can anyone recommend a resistor circuit that will attenuate the input of the tube monoblocks approximately 12db? The amps have about 20db gain. I've tried a few t-pad configurations that work but seem to affect certain frequencies more that others. In a word, they have sounded horrible. The attenuation is needed to get a digital equalizer working at peak performance between a preamp and the monoblocks. Many thanks.
