Hey Wayne, Thanks for looking in on this post! Yes, from a visual perspective. I have done some mockups of the baffle arrangements so that I could play around with this tilt/angle idea a bit. I built a chival (sp.) style floor mirror a long time ago and was thinking about how an adjustable tilt back for a mirror would be a welcome addition to my Mini's. I could have more flexibility in listener location this way. Tilt back more/listen more near field without a sonic shortening of the imagined soundstage? Well it sort of led me to the idea of two tilting baffles that could focus the phantom image of the two woofers atop the center mounted supertweeter. Pseudo point source or MTM alignment sort of thing only on an adjustable Ob. I know crazy idea.... The mockups proved that this may be worth pursuing. The Mini's used rather inexpensive drivers and I was always wondering what an up graded (quality) driver would sound like. I also want as much sens. as possible and 4 ohms for my Decware buddies little Zen amps. would also be welcome. This may never see the light of day, other than in my own music room, but I feel like I will if nothing else learn something more from the trials. Thanks again Wayne Darrel
