Dave, I've found that in-room measurements with an SPL meter are next to useless. Everything is so critically dependent upon room interaction that a minor -- a few inches -- change in positioning of anything makes the results completely different. Above 1k Hz, even moving your head will dramatically change the SPL readings. These are harsh words for a guy that designs by modeling and measurement. All you can do is pour yourself a couple of fingers of single-malt and listen. Your ears will tell you when it's right. Bob
