Do you have Hornresp? If not, grab a copy. Entering the electro-mechanical parameters is a snap, just click on the fields in the lower area of the screen and type them in. You can even double click these fields and the program will prompt you for T/S specs, which it will then convert to force/mass/compliance values. The rest of the data entry is equally simple, just enter length and area and front and rear chamber volume. If you get confused, I'll send you one of my data files as a starting reference. You can always write a post here if you get stuck.
