The whole philosophy of multi-sub is to introduce dense interference. My point is whether or not the deep bass range should be covered by randomly placed subs or symmetrically placed subs, I think the midbass sound sources probably should be symmetrical and closer to the mains. You can't run a distant sub up too high, but you do want multiple sound sources through the entire modal range. That includes some frequencies that are really too high for distant subs, in my opinion. It's a competing set of priorities at the high end of the modal range.
