Subject: Re: Heavy-cones verses light-cones in basshorns Posted by Wayne Parham on Sun, 27 Aug 2006 01:38:37 GMT View Forum Message <> Reply to Message

Certainly we don't want cone breakup but beyond that, we're also talking about diaphragm mass, suspension stiffness and excursion. One type of driver has a relatively light cone with stiff suspension and short excursion with a lot of magnetic energy concentrated in the gap. Another type of driver has a heaver cone with looser suspension and longer excursion with the coil in the gap.
