I've seen your idea, and I think there's merit in your approach. Please do elaborate here though, because I think it is interesting for everyone that reads this forum. The easiest way I can think of to measure the effects of your resonators is to run an impedance sweep. That's not difficult at all. I would definitely suggest to do frequency response measurements too. You might want to download Speaker Workshop. It will do both an impedance chart and measure acoustic amplitude response, so it will be very useful for you and it's free to download.
