Hi Wayne. I can see in my post that I wrote both bipole and dipole, but the speaker will be used as a bipole, and maybe I'll try dipole just for fun. The distance from the midwoofer and the horns are about 4,5cm, that's a 1/4 wavelength of 1900hz. Do you think I should use a crossover of 1900hz instead then? And what about putting the horns in series or in parallel?
