Hi Everyone,I should probably work this out myself, but it's friday! My question is:I have a full range driver, with a supertweeter corossed over at 16000 HZ at 6 db/octave. Both drivers have similar eff at 95 DB. The 90 degree phase shift that ensues: how do i counter that? Do i push the tweeter forward in relation to the full range? and by how much?Placement of the tweeter is TOTALLY flexible. -akhilesh
