I have access through work to various size horns all exponential in profile ranging from horns with a fundamental frequency of 350Hz about 400mm 16" long to 60Hz ones just over 3m They all have throat sizes of 35mm Now what do I need to make these into speakers for my own entertainment. Can I get bass with a throat that small? I have tried shoving a very cheap piezo tweeter down a 1m one and it sounded okayish but the driver was so far from being flat in the frequency response that okayish was the best I could hope for. It is loud enough to be a speaker for the lads in the factory to listen to the radio on even run from a cheap 13w radio. It would be cool as they are all spun 316 stainless
