Hi all,I've never posted here before but I need a little help. I have a pair of FE206Es in BR cabinets that I built about a year ago and I would like to design a baffle step correction circuit for them. I have downloaded the "Edge" program (thanks Mr. King!) but I'm having a little trouble understanding everything I'm looking at. Can someone hold my hand a while and walk me through this first design? Any help is appreciated.G
