Some of you may have read some version of this post on other forums so please disregard BUT for those who did not: I recently experienced a stunning increase in sound quality from my fully broken in Fostex FE168EZ, due to very high humidity (between 70 and 80%). Did anyone experience same thing? How do you explain? I would love to keep this "sound" forever if I could find a way. Of course, I could sell the house and get myself a couple pairs of drivers and experience with various doping agents to see the effect...
