Small horn huh? Well the basic laws of physics are kinda not with you for a bass horn. I have tried small horns and just wasn't satisfied. As Vb goes up then efficiency goes up. The basic dimensions are on page 1 of this link. Just make the height dim 63". The rest are very close. I haven't finished the complete dwg for this horn as it took me around 6 months to design and finalize and test my last design. It's a complicated design and will demand a higher level of woodworking skills. ron
