Wayne, When I was referring to BLH, I was talking about a horn loaded rear wave that should be corner loaded to get any real extension. These tend to have greater bass output. I realise that the short small opening horn typically found on BLH's and almost all FLH's that are designed to be placed farther into the room (typical "audiophile" regulations) aren't really any more efficient in the bass than any other type of box. I do find the actual sound to be typically a bit different, though, so I suspect there's something going on that makes a difference between the different type of bass boxes, but don't ask me what, as I'm not any kind of engineer. I just listen. Maybe I haven't listened to enough variety yet. I'm always open to people sending me (or stopping by with) different speakers so I can broaden my experience. Dave
