Here is one at

93.5db:<http://www.partsexpress.com/pe/showdetl.cfm?&DID=7&Partnumber=264-578>I think you'll find the 1.5 db difference will hardly be audible at higher frequencies. But if phy-hp is selling a piezo for \$300 it must be something special. IF you are spendign that kind of moneyy look at the JBL & B&C bullet supertweeters as well (of course eff is far higher). -akhilesh
