I have a question. I was under the impression that a relatively high QTS is desirable for an open baffle driver. I looked at the specs for the 15" P Audio drivers recommended for open baffle mounting. The QTS for the BM15CXA is .24, and for the BM15X38 it's .22. These values seem more appropriate for horn or MLTL mounting. Wouldn't open baffle mounting produce weak bass response?

P Audio Drivers T/S Parameters
