I have always wondered if you could model the a Lowther EX driver as an undersized bass reflex system, which you then put into a larger resonant enclosure. The potential result could be similar to a double bass reflex system. If this were the case, and the designer mistakenly put the EX driver into a DX cabinet then it would not be too surprising that a non-optimal system was the result. Maybe there would be some advantage gained if the cover was modeled and the designer actually took it into account when designing the enclosure. I don't have any EX drivers so this is pure speculation.
