Subject: Re: Line array question using Bandor 50mm driver? Posted by Bill Fitzmaurice on Sun, 05 Sep 2004 12:59:37 GMT View Forum Message <> Reply to Message

The combing effect here would only extend a few inches out from the baffle at best, so that's not a particular concern. What would likely be problematic is off-axis response. The axial charts look OK out to 12kHz or so but with a 50mm radiating plane it's a very safe bet that the -6dB response at 30 degrees off-axis won't extend beyond 10kHz at best. Good HF dispersion requires no more than a 25mm radiating plane with point source drivers, and smaller than that is even better.
