Hmmm. Ok. So that original *pic* which look a bit slanted is an inaccurate representation. I'm seeing just the 4 inchers and the tweets but no details of the casework. Well, I guess I'll have to wait for publication. I would guess from your other designs that the line array would focus the energy from the backwave either up or to the sides in a mirror image and in a v-shape. The samples... or proof of concept I guess... that I have are just the 4 inchers at the top end of a baffle with overall height of 48 inches. The stand for them is jimmy rigged.
