Not MTM! It's MCM's #53-325, and it sells for $14.75. The shielded version, #53-480 sells for $10.95. They don't specify the impedance, but I measured about 6 ohms DCR which suggests to me it's an eight ohm impedance driver. Needless to say, at this price it is not a high end driver, but with it you will get a line array for about $200 total that will sound as good as most mass market speakers, with the bonus of high sensitivity, high impedance, and a very dynamic sound.
