Subject: center design?

Does anyone here use their arrays as HT speakers? If so, what kind of design matches well as a center for an array? I'm planning on designing a substantial speaker, probably around 7 feet tall using the WR125ST and the Fountek NeoCD2 tweeter. These will be for use in a dedicated theater, but I'm having trouble deciding what to do for a center. I don't really like the idea of simply laying an array on its side, since, the way I understand it, the tweeter array would no longer have limited vertical dispersion, which is important in a theater. I've thought about simply building a third speaker, stand it upright behind the screen, but I'm not thrilled about having to go to a perforated screen. Is there a horizonal center design anyone knows about that can keep up with a set of high-powered array mains?
