Hi ... I see several configurations for woofers to use with arrays. A lot of us do arrays with small speakers (NSB, TB, etc) that do not go down very low to be able to just use a subwoofer. Are there some good rules for woofers? Crossing to arrays could be in the 120hz to even 400hz range. I've seen some \$ comparisons of multiple woofer array vs. standard woofers, but little or no evaluations on which is actually better and more compatible. Polar patterns are also a consideration. Zene
