>>And MAYBE the driver really is all VMPS claims it is, and my>>problems are just getting the crossover right ? A DIY rule: Don't fall prey to marketing propaganda I wouldn't use a driver that has a weak bottom and top endbecause it can create more problems to solve, assumingthe driver you want has those issues. If you want to build a line array, have you auditioned any arraysto establish a reference point? What is wrong with a coned driver 4" - 6" mated to a line of tweeters \$4 - \$118 ?
