I purchased the Behringer but didn't realize that it was rated for 15V-48V My Marantz' microphone board is rated for 12V only. The Mic seems to work perfectly. Do you think this is affecting the frequency response of the Mic? In other words would the Mic still be flat as the specs say in your opinion? There is no way to turn off the phantom power supply in the Marantz. Thanks for your opinion. Chris Hope you don't mind being my personal audio consultant
