Found this zenith mod cv 5000, pushes tons of air cleanly like a subwoofer does. Has 90w, Low level rca in [CD player],S/PDIF Subwoofer out,rear out L&R, micro out L&R. Play my cd player fine by itself. If I plug in a speaker (RCA)to the rear out or micr out all I get is distorion and fuzz. What is micro out? I don't have test equipment but is it overloading my 100w satellite speakers? Does OHM matter here? Thanks for any info.
