Hi, I currently play a Marshall JCM800 with a Marshall 4X12 w/ v-30s. The other day just out of interest I borrowed my friend's pedal that allows for two amps to be run at the same time... I hooked up my Marshall amp and my old bass amp (200 watts solid state) with another 4X12 cab and a 1X18 cab. The sound I got from that was surprising... I put a Boss overdrive pedal in the signal path so it affected both amps... the Marshall was the overdriven distortion sound I'm used to, but then the bass amp running at the same time, created a gritty low end sound. I really liked the sound it made, good and dirty for the style of band I play in. What I NEED to know before I do this again, is if it's safe. Am I going to damage anything by using a bass amp with an electric guitar? Or is it safe to use a bass amp with an electric guitar? Thanks to anyone who can answer this question for me.
