---

I have a echolette b40n head that sounds like I play it through a ring modulator or something similar. This usually starts 10-15 minutes into band practice (when the amp is getting warm?) I have cahnged the three preamp tubes and the two el34s. The only tube I havent switched is a gz34. I was told where I bought the tubes that this wasnt necessary to change as long as sound came from the amp. Anyone know what it can be?
