a question about how sovtek mig-100s are wired. i'm looking to set up a full stack, and i've heard varying stories on how this can be done with my head. for those who aren't familiar, the mig-100 (not the 100H, 100U, or 100B...just mig-100) has 3 speaker outs on the back panel: one for 4, 8, and 16 ohms. two gear heads who i both usually trust gave contradicting answers. one said that any of these 3 outputs could be used in conjunction with each other. i.e. i could hook my 16 ohm marshall to the 16 ohm out, and a 8 ohm ampeg v-4 to the 8 ohm out. however, another person told me that these outputs were not designed for this purpose, and using them simultaneously like such would hurt my amp. they said my only real option is to rewire either of the two cabs to have parallel inputs/outputs, and only use one of the speaker outputs on the back of my head. any one out there have experience with these heads? i've had mine for 2 years and have always dreamt of using a full stack, but only recently acquired a suitable 2nd cab. shoot me a line if you know. Thanks, Jasper
